RECENT USSR WORK IN THE FIELD OF SYNTHETIC PHARMACEUTICALS, ANTIBIOTICS, HORMONES

/Numbers in parentheses refer to appended sources.7

According to N. Polyakov, Director of the Chemicopharmaceutical Scientific Research Institute imeni S. Ordzhonikidze, the progress made by this institute in 1950 was marked by the following achievements, as well as other notable results.

Tibon has been successfully synthesized at the institute. This substance is effective in the treatment of tuberculosis of the throat, of the mucous membranes of the mouth, and of the bladder. It is also effective in the treatment of recent tubercular peritonitis, empyemas, and lymphatic knots, as well recent pulmonary tuberculosis. A method for producing Tibon industrially has been developed.

The hormone division of the institute has developed methods for producing testosterone, testosterone propionate, progesterone, and pregnene.

A new Soviet remedy, Tezan, has been obtained at the institute's laboratories. This remedy, which is effective in the treatment of leukopenia, is being produced in sufficient quantities to satisfy the current demand.

In addition to developing new therapeutic agents, the personnel of the institute as a whole has rendered assistance to enterprises of the Main Administration of the Medical Industry. As a result of improvements introduced in the course of this work into the process for the production of pyramidon the yield of pyramidon has been raised by 15%.

The following activities have been planned by the institute for 1951: development of new effective remedies for the treatment of malignant tumors, tuberculosis, and other infectious diseases; development of methods for the production of new hypnotics and analgesics; work on substances for the therapy and rophylaxis of thrombophlebites; development of continuous processes for the manufacture of a number of substances, including sulfonamide drugs.(1)

S. Chesnokov, Chief Physician of the Order of Lenin Hospital imeni S. N. Botkin at Leningrad, announced that in 1951 the infectious diseases department of his hospital will introduce into polyclinical practice treatment of chronical dysentery with phytoncides, treatment of scute gastro-intestinal infectious diseases with synthomycin, and treatment of scarlet fever with penicillin aerosols.(2)

The Institute of Experimental Medicine of the Academy of Sciences Latvian SSR has developed a new remedy for the treatment of tuberculosis. This remedy, which has been tested clinically, has yielded positive results in the treatment of tuberculosis of the skin and of the bones.

The Institute of Physiology of the Academy of Sciences Kazakh SSR has developed a remedy for the treatment of shock. On the basis of clinical results which had been carried out, the new remedy was found to be very effective.

A new protein blood substitute was developed by the Institute of Biochemistry of the Academy of Sciences Ukrainian SSR. This blood substitute gave excellent results in preliminary clinical testing. (3)

Recently, the Pharmacological Committee of the Scientific Medical Council of the Ministry of Public Health USSR authorized the use of Dibazol, a new chemotherapeutic agent for which methods of industrial production have been developed. The compound in question was synthesized by Prof B. A. Poray-Koshits and Candidates of Chemical Sciences L. S. Efros and O. F. Ginzburg. In connection with an extensive investigation on the action of compounds which affect the nervous system (an investigation which has been carried on for a number of years at the laboratory of the Chair of Pharmacology, Naval Medical Academy), M. A. Rozin established that the compound synthesized by Poray-Koshits increases the work capacity of healthy people and exerts a therapeutic effect in certain diseases of the nervous system. Dibasol is effective in restoring muscular tonus and the ability to exert muscular movements which have been lost as a result of poliomyelitis. It is also effective in the treatment of neuritis due to various causes (particularly neuritis of the facial nerve), neuritis and polyneuritis brought about by poisoning with carbon monoxide, mercury, or lead, and afflictions of the peripheral nervous system caused by overexertion or overwork. More than 1,000 patients already have been treated with Dibasol and striking cures were obtained in cases where no other remedy helped. There are indications that Dibazol is also effective in treating spastic paralyses of children and of aftereffects produced by traumatic injuries of the spine. (4)
